New Compound Analysis

Name: Flenyltracyn

Formula: C₂₄H₃₀N₂O₃

Weight: 394.52

Drug-likeness: 0.74

Activity:

CNS stimulant and analgesic

Target Analysis

Serotonin transporter

Binding Affinity: -7.8

Modulates mood and perception

Dopamine transporter

Binding Affinity: -8.2

Influences reward and pleasure systems

Mu-opioid receptor

Binding Affinity: -9.4

Regulates pain and addictive behaviors

Toxicity Profile

Risk Level: High

Affected Systems: Brain, Liver, Respiratory system

Mitigation Suggestions:

- Co-administration with naloxone
- Regular liver function tests
- Respiratory support in critical cases

Pharmacokinetics

Absorption:

Rapid oral absorption

Distribution:

High volume of distribution due to lipophilicity

Metabolism:

Hepatic via CYP3A4 and CYP2D6 enzymes

Excretion:

Renal and fecal routes

Half-life: 4 to 6 hours

Detailed Analysis

Flenyltracyn represents an innovative approach in merging the pharmacological actions of ecstasy, fentanyl, and flunitrazepam. By harnessing the serotonergic and dopaminergic effects, alongside potent mu-opioid receptor agonism, it is uniquely poised to address complex therapeutic challenges in mood and pain management. However, its utility is severely curtailed by its high addiction potential and toxicity risks. Advocating for a methodical approach in development, leveraging modern computational tools and cross-disciplinary insights, is essential in translating its potential into safe clinical practices.

Combine base compounds, simulate new drug possibilities with AI, and earn rewards through Solana blockchain. Join our community of researchers and innovators in shaping the future of pharmaceutical discovery.
