New Compound Analysis

Name: Cannabiamphiron

Formula: C₂₁H₂₉NO₃

Weight: 343.47

Drug-likeness: 0.45

Activity:

Neurotransmitter modulation

Target Analysis

Dopamine receptor D2

Binding Affinity: -7.5

Targeting this receptor modulates mood and behavior.

Mu-opioid receptor

Binding Affinity: -8

Activates analgesic and rewarding effects, contributing to addiction.

Toxicity Profile

Risk Level: High

Affected Systems: Brain, Heart, Liver

Mitigation Suggestions:

- Dose regulation
- Monitoring for addiction signs
- Combined therapy with protective neuroagents

Pharmacokinetics

Absorption:

High oral bioavailability

Distribution:

Crosses blood-brain barrier and highly lipophilic

Metabolism:

Hepatic metabolism via CYP3A4

Excretion:

Renal and fecal routes

Half-life: 6-12 hours

Detailed Analysis

Cannabiamphiron is a novel compound derived from combining key structural and functional elements of cannabis, ecstasy (MDMA), and heroin. This compound aims to tap into the active regions of these substances, targeting dopamine and opioid signaling pathways. The resultant effects are anticipated to be both analgesic and mood-modulating, achieved through the drug's interaction with the Mu-opioid and dopamine D2 receptors. Although promising, the compound presents challenges with its high potential for misuse and toxicity. Its pharmacokinetic profile suggests efficient central nervous system penetration with a relatively moderate elimination half-life, allowing for potential therapeutic dosing. However, given its compound nature, rigorous safety and efficacy trials are imperative to mitigate risk factors, including addiction and organ-specific toxicities.

Combine base compounds, simulate new drug possibilities with AI, and earn rewards through Solana blockchain. Join our community of researchers and innovators in shaping the future of pharmaceutical discovery.
